Result, Conclusion and Reference

Formula 1 Race Intelligence – Part 4 of 4

1. Results

The results below are organised by scenario. After checking each dashboard, replace the prompts in the last column with the actual figure or name you see.

1.1 Scenario 1: Team Performance Strategist

Question	Source worksheet	Result to record
How does the selected team's points trajectory compare with Red Bull Racing and Mercedes?	Team Championship Trajectory	The season where the gap was smallest and largest
Which starting compound performs best on each circuit type, and in wet races?	Tyre Strategy	Best compound per circuit type; wet race difference
Which nationalities are the strongest talent pools?	Talent Pools	Top three nationalities by points and podiums

1.2 Scenario 2: Broadcast Analyst

Question	Source worksheet	Result to record
Who leads the driver leaderboard?	Driver Leaderboard	Top driver and points total
Which countries have hosted the most Grand Prix rounds?	GP Host Countries	Top host countries
Who has the most podiums, by driver and by team?	Podiums by Driver / Podiums by Team	Top driver and top team

1.3 Scenario 3: FIA Technical Regulation Analyst

Question	Source worksheet	Result to record
Are DNF causes concentrated in particular teams or circuit types?	Failure Type by Team and Circuit Type	Most common cause and where it clusters
Has reliability improved over the seasons?	Reliability Trend by Season	Direction of the trend and the best and worst seasons
Which drivers retire most often?	DNF by Driver and Race	Drivers with the highest retirement counts

2. Conclusion

The project shows that 17 seasons of race records can be turned into focused, interactive views for three different audiences. Strategists can benchmark their team against the leaders and choose tyre and recruitment strategies, broadcasters can retrieve statistics and graphics quickly, and regulators can examine failure patterns and reliability trends. Summarise your two or three most important findings here in your own words.

3. Limitations

- The data covers 17 seasons and 6,464 records, so conclusions apply only to that period.
- It has no lap-by-lap, qualifying, weather, or car performance data.
- Reliability is measured through DNF counts, which combine very different causes (collisions and mechanical failures).
- Regulation changes are not recorded in the data, so improvements in reliability cannot be tied to a specific rule without outside information.

4. Future Work

- Add lap-by-lap and pit stop timing data.
- Add qualifying results and grid positions.
- Add weather and track temperature.
- Add a forecast of championship points.

- Add a record of regulation changes by season to test their effect on reliability.
